Relativistic effects: classical model

Classically... (Bohr's model)

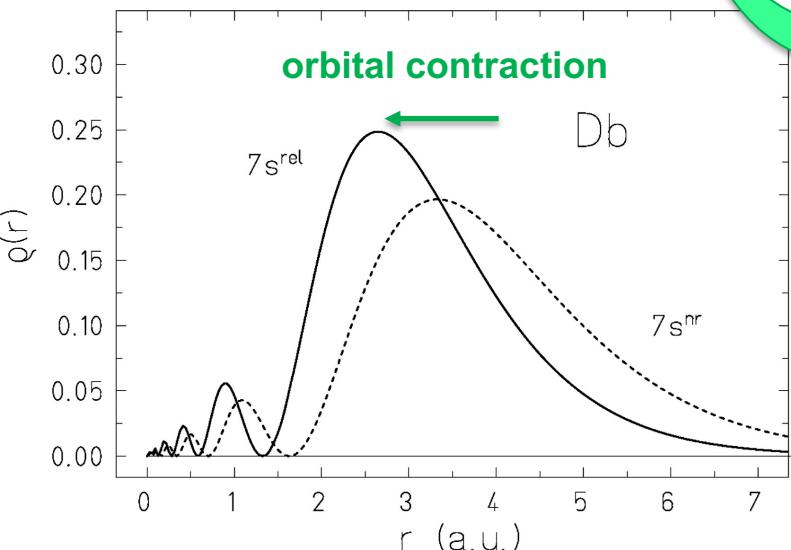

$$\nu_n = \frac{Ze^2}{4\pi\varepsilon_0\hbar n} \quad r_n = \frac{4\pi\varepsilon_0\hbar^2 n^2}{Ze^2 m_e} \quad E_n = -\frac{Z^2 e^4 m_e}{32\pi^2 \varepsilon_0^2 \hbar^2 n^2}$$

in the theory of relativity

$$m_e^{rel} = \frac{m_e}{\sqrt{1 - (\nu/c)^2}}$$

$$(m_e^{rel} \approx m_e \ (\nu \ll c))$$

$$\nu_1(\text{H}) \approx c/137$$

$$\nu_1(\text{Hg}) \approx 0.6c$$

$$r_n^{rel} = \sqrt{1 - (\nu/c)^2} r_n$$

$$E_n^{rel} = \frac{E_n}{\sqrt{1 - (\nu/c)^2}} < E_n$$

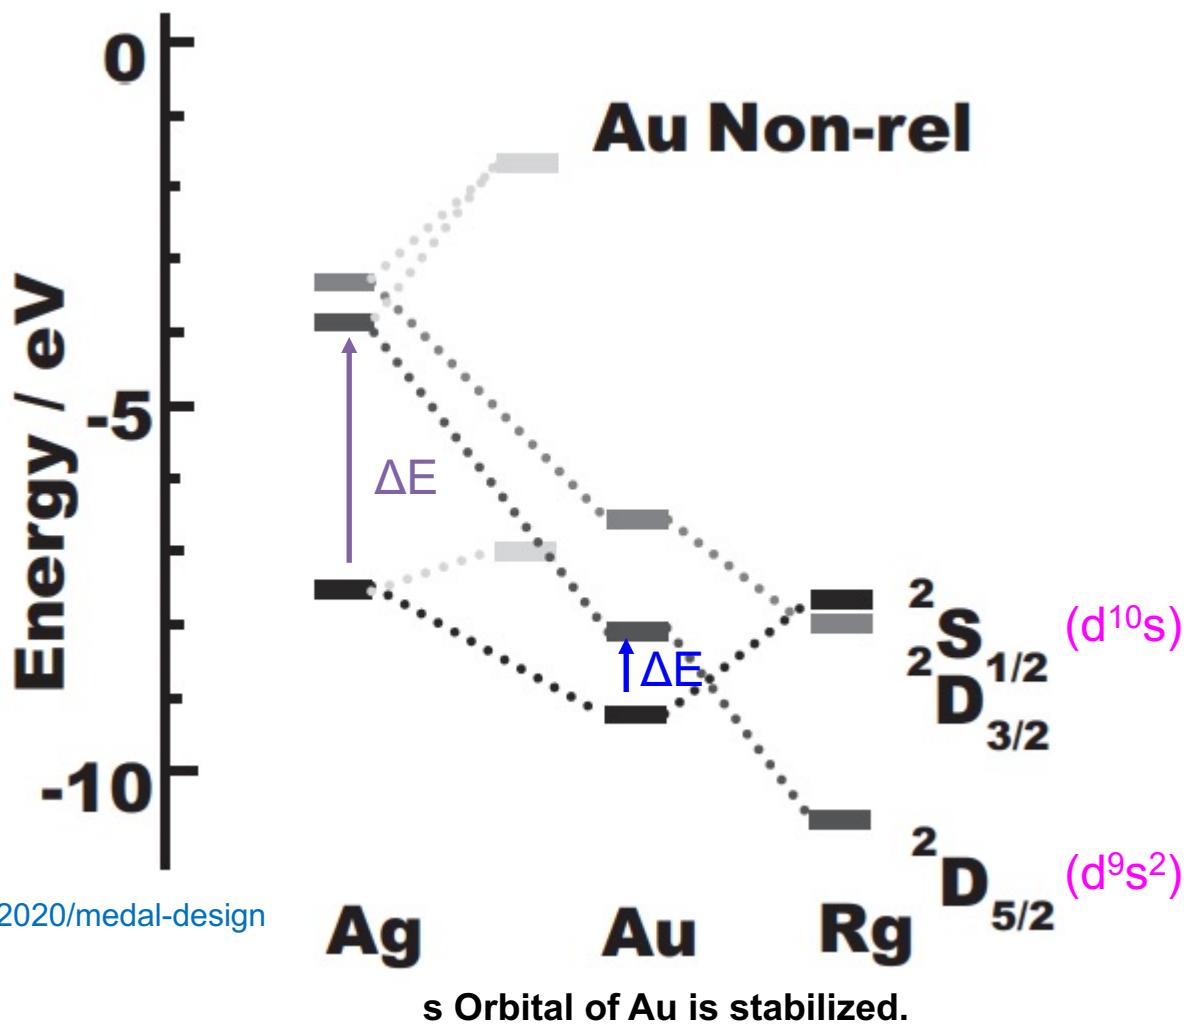

orbital contraction

stabilization

Only if Z does not change.

→ contraction and stabilization for s, p ($p_{1/2}$) orbitals
the opposites for d, f orbitals

Relativistic effects: example

Valence -価数-

a) Number of bonds (結合数)

* Coordinate bonds (*dashed bonds*) are not counted.

b) Valence (原子価)

the number of electrons that an atom uses in bonding

$$b = a + d$$

c) Oxidation number (酸化数)

the charge remaining on an atom if covalent electron pair are transferred to the **more electronegative partner**

→**ionic character**

$$c = (\text{charge on compound}) - (\text{charge on ligands})$$

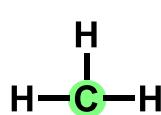

d) Formal charge (形式電荷)

the charge remaining on an atom when all ligands are removed **homolytically**
→**covalent character**

e) Coordination number (配位数)

the number of atoms bonded to the atom of interest
(sometimes, number of atoms close to the atom)

sometimes called
“価数”

The charge on Db ($\approx Q$) decreases.

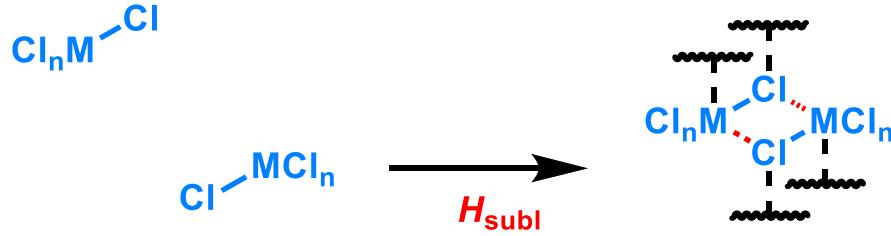

→ Db-Cl bond is predicted to be less ionic.

To measure the chemical character of Db

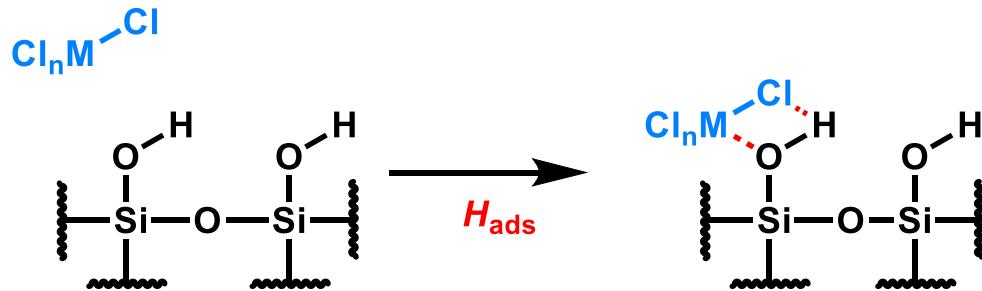

A trace amount of Db compounds will be available.

→ Only physicochemical parameters could be obtained.

a) Sublimation enthalpy: **macroscopic** parameter

b) Adsorption enthalpy: **microscopic** parameter

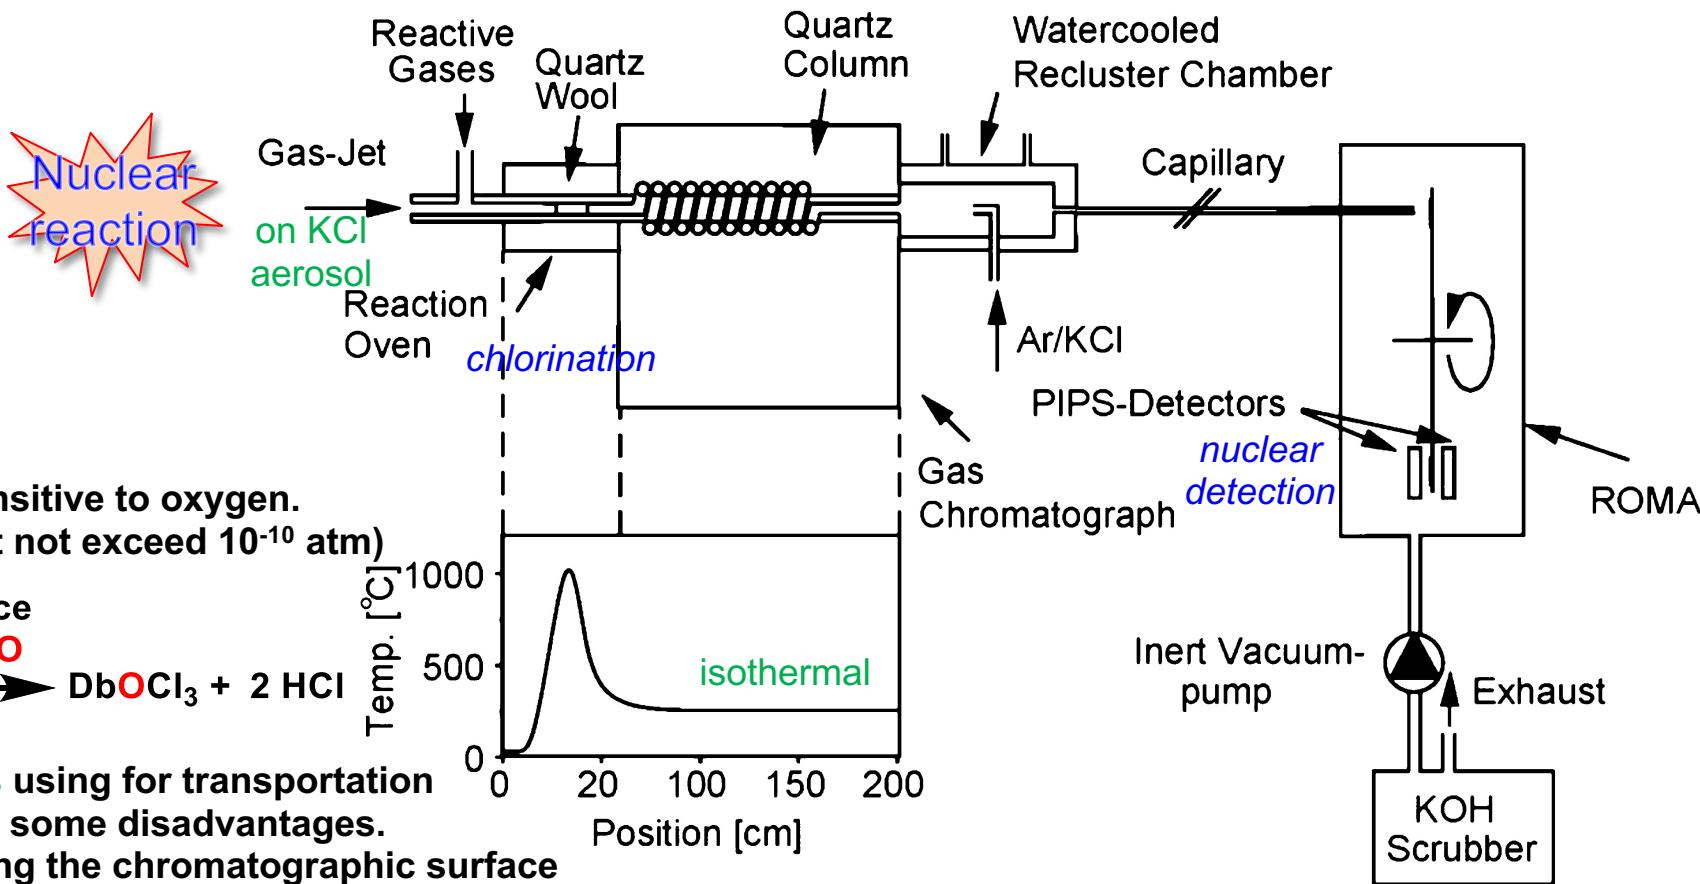

There should be a correlation.

- 2) Türler, A.; Eichler, R.; Yakushev, A. *Nucl. Phys. A* **2015**, 944, 640.

Model experiment (1)

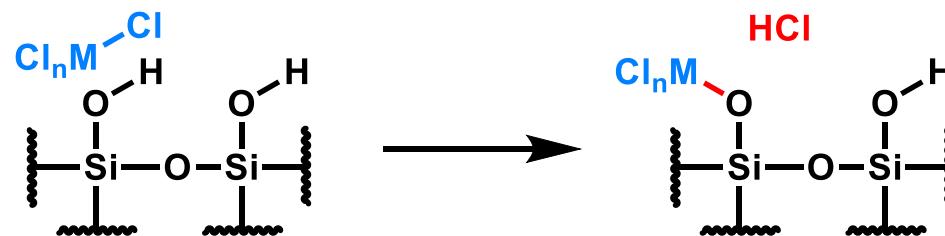

Improved set-up

without aerosols MOCl₃ formation

800~1000 °C

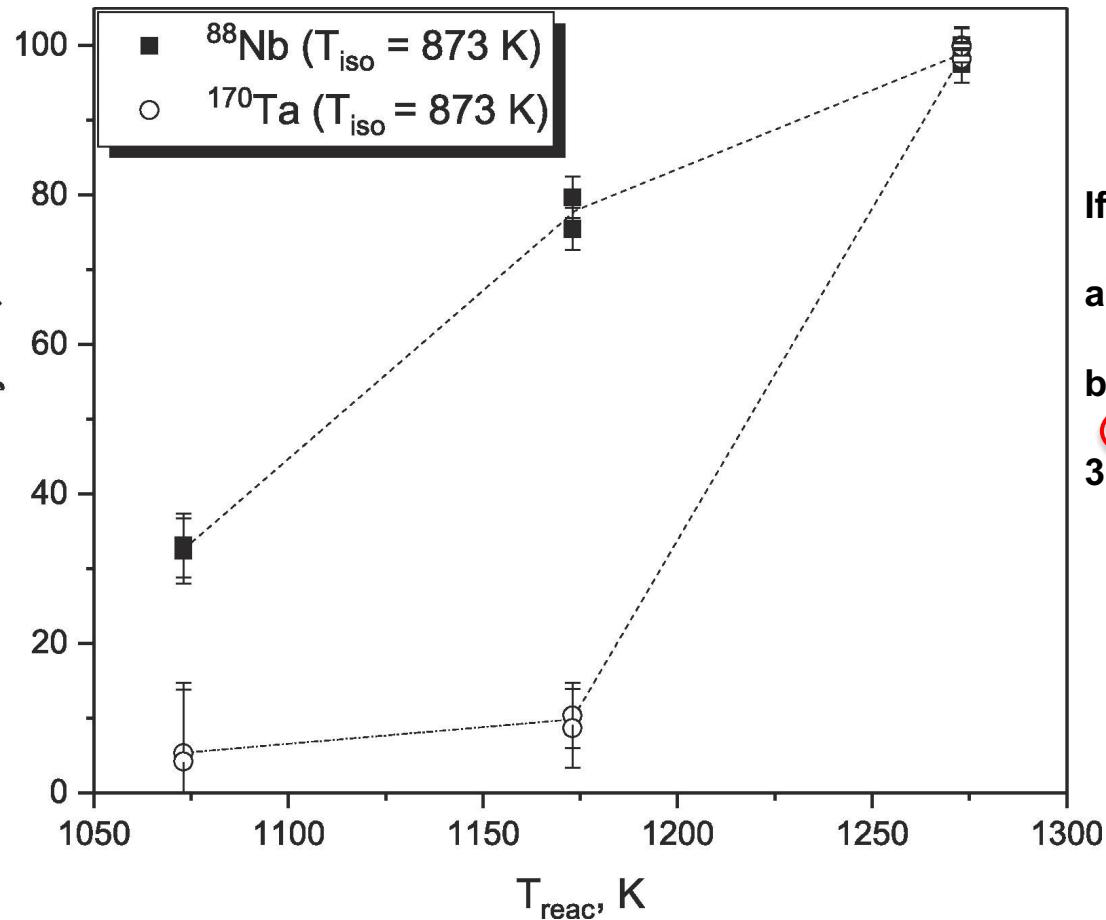

* pre-treated with chlorination gas

- 1) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *Inorg. Chim. Acta* **2019**, 486, 361.
- 2) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Ito, Y.; Shirai, K.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *J. Radioanal. Nucl. Chem.* **2019**, 320, 633.

Section I: Reaction temperature

Relative yields of volatile Nb/Ta compounds

If $T_{\text{reac}} < 1273 \text{ K}$

a) Formation of MOCl_3 was too slow.

b) Cl_2 pressure was too low.

→ T_{reac} is set at 1273 K.

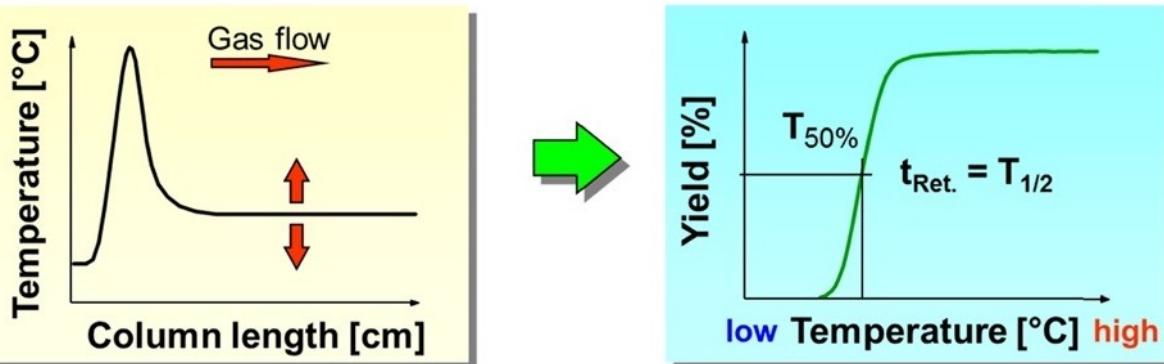

- 1) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *Inorg. Chim. Acta* **2019**, 486, 361.
- 2) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Ito, Y.; Shirai, K.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *J. Radioanalyl. Nucl. Chem.* **2019**, 320, 633.

Section II: Gas-chromatography temperature

Isothermal Gas-Chromatography

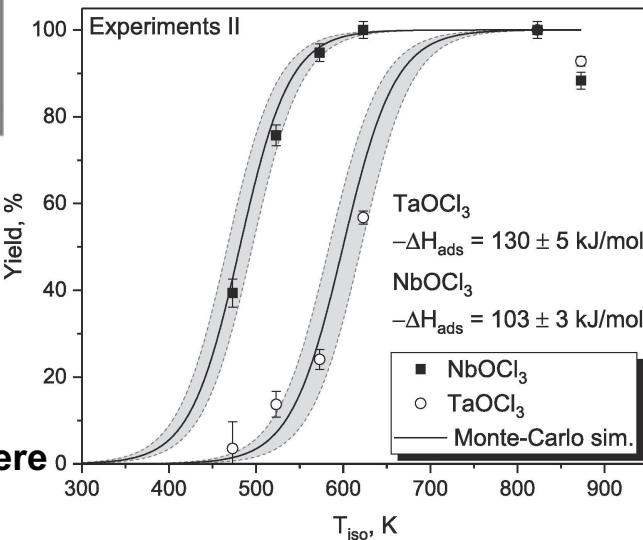

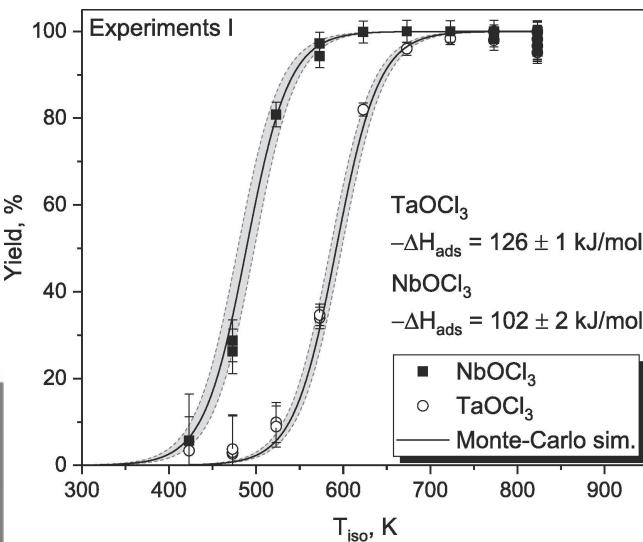

high temperature → weak adsorption on quartz
→ short retention

This correlation depends on ΔH_{ads} .

Chemical species	$-\Delta H_{ads}$ (this work) kJ/mol	$-\Delta H_{ads}$ (literature) kJ/mol
NbOCl ₃	102 ± 2	(a)
	103 ± 3	(b)
	102 ± 4	average
		99 ± 1 [12]
		92 [32]
TaOCl ₃	126 ± 1	(a)
	130 ± 5	(b)
	128 ± 5	average
		157 ± 12 (c)
		133 ± 20 [37]

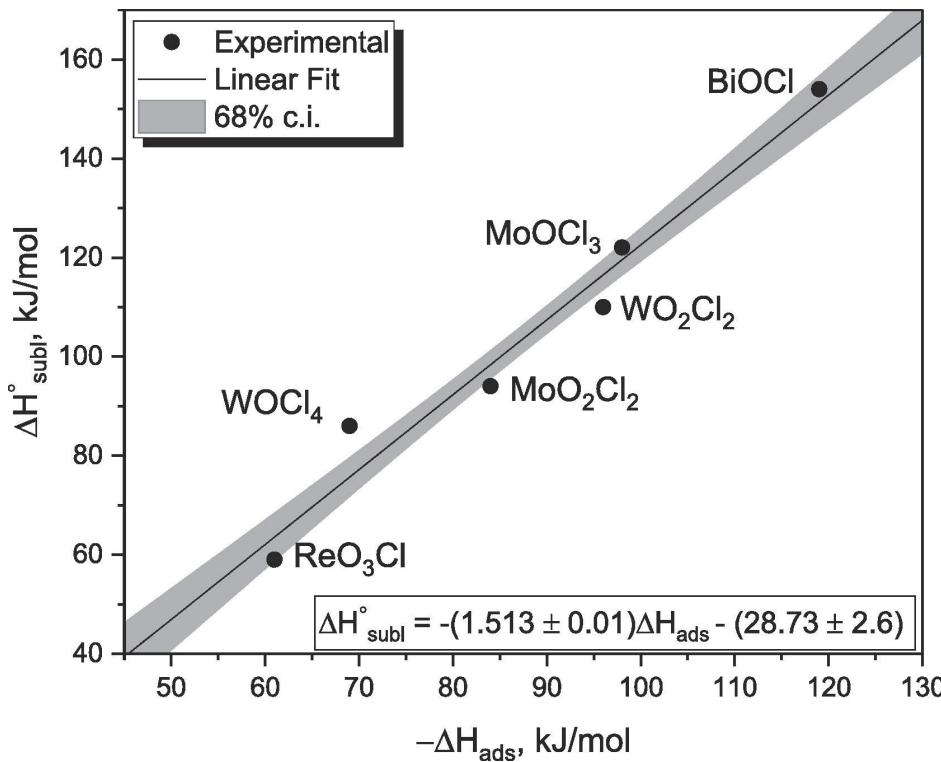

Two sets of experiments (I, II) were performed.

- Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *Inorg. Chim. Acta* **2019**, 486, 361.
- Türler, A.; Eichler, R.; Yakushev, A. *Nucl. Phys. A* **2015**, 944, 640.

Conversion to ΔH_{subl}

A semi-empirical correlation between ΔH_{ads} and ΔH_{subl} can be obtained using similar chemical species (oxychlorides).

literature data

$$\Delta H_{\text{subl}}^0 (\text{NbOCl}_3) = 128.5 \text{ [kJ/mol]}$$

$$\Delta H_{\text{subl}}^0 (\text{TaOCl}_3) = 170 \text{ [kJ/mol]}$$

$$\Delta H_{\text{subl}}^0 (\text{NbOCl}_3) = 126 \pm 10 \text{ [kJ/mol]}$$

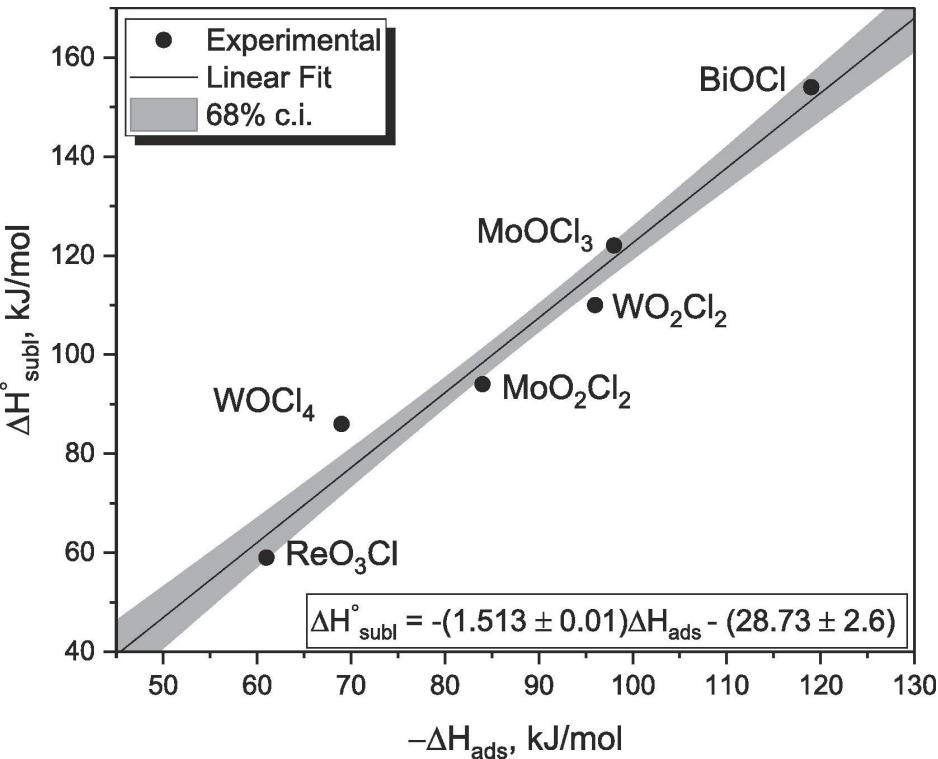

$$\Delta H_{\text{subl}}^0 (\text{TaOCl}_3) = 165 \pm 11 \text{ [kJ/mol]}$$

extrapolation

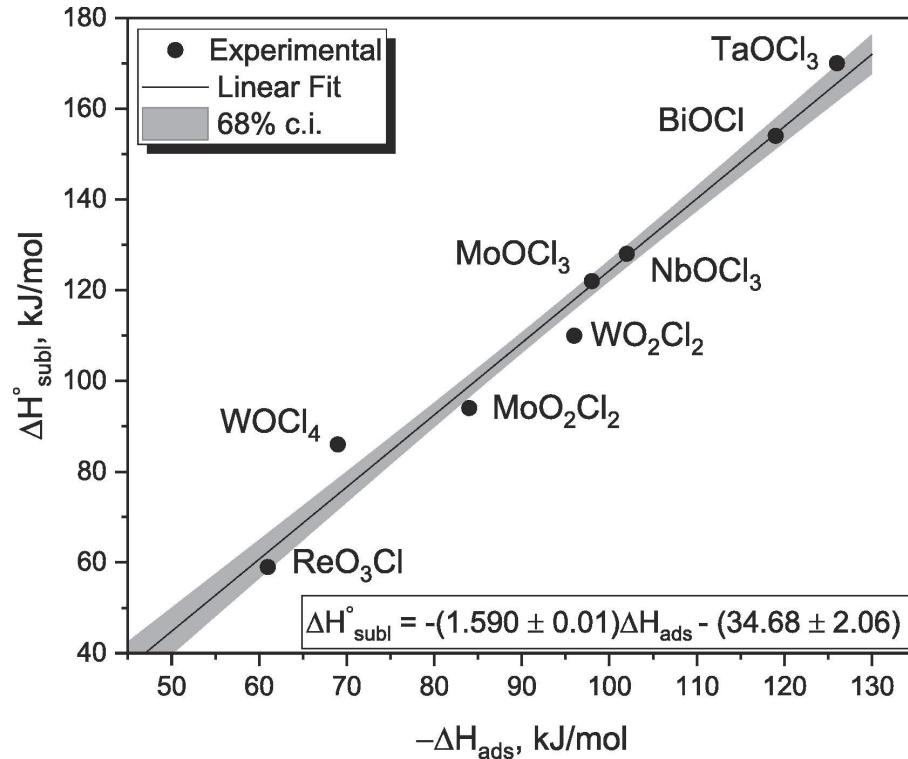

$$\Delta H_{\text{subl}}^0 \approx -(1.513 \pm 0.01)\Delta H_{\text{ads}} - (28.73 \pm 2.6) \text{ [kJ/mol]}$$

- 1) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *Inorg. Chim. Acta* **2019**, 486, 361.
- 2) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Ito, Y.; Shirai, K.; Suzuki, H.; Tokoi, K.; Toyoshima, A₁₈; Tsukada, K.; Nagame, Y. *J. Radioanaly. Nucl. Chem.* **2019**, 320, 633.

Optimization of correlation

Obtained ΔH_{ads} were added to the dataset.

$$\Delta H_{\text{subl}}^{\circ} \approx -(1.590 \pm 0.01)\Delta H_{\text{ads}} - (34.68 \pm 2.06) \text{ [kJ/mol]}$$

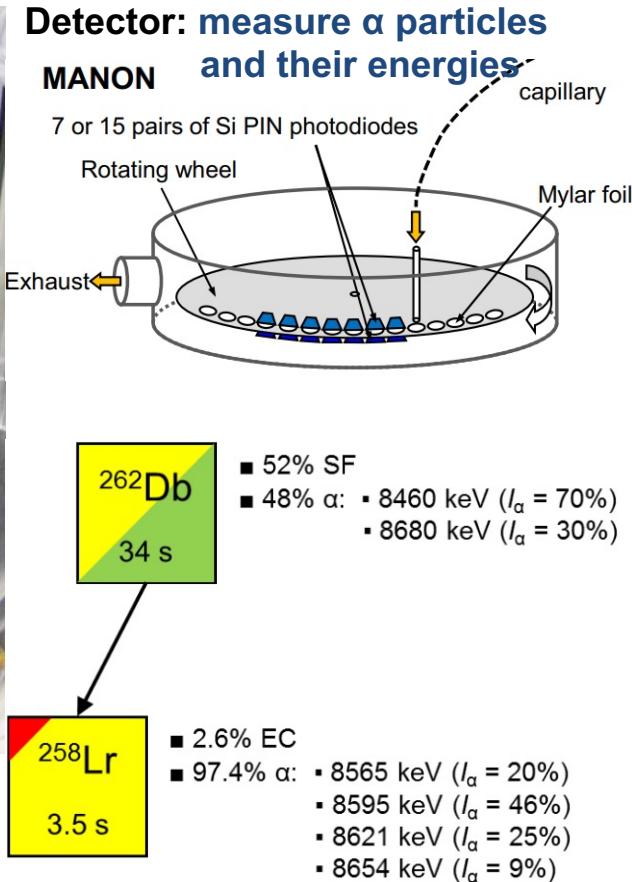

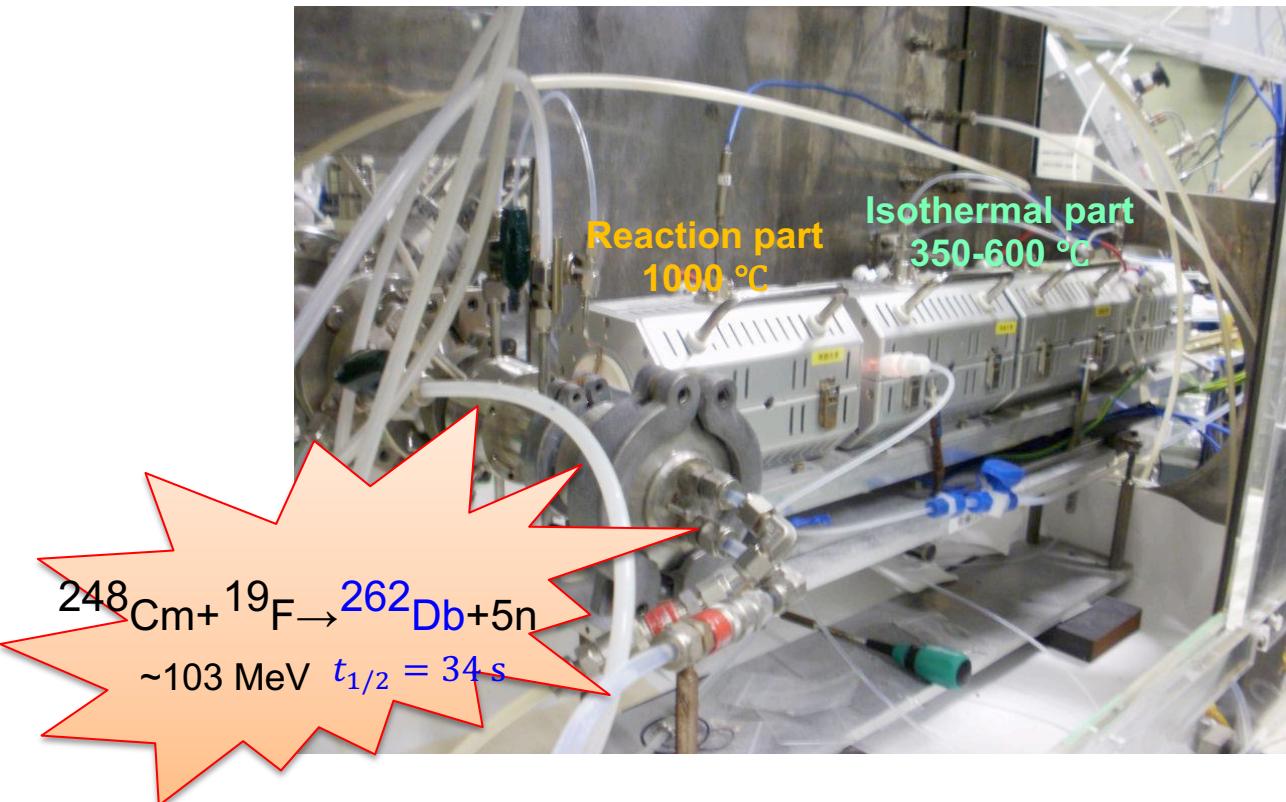

This would be useful to extrapolate ΔH_{subl} (DbOCl₃).

- 1) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *Inorg. Chim. Acta* **2019**, 486, 361.
- 2) Chiera, N., M.; Sato, T., K.; Tomitsuka, T.; Asai, M.; Ito, Y.; Shirai, K.; Suzuki, H.; Tokoi, K.; Toyoshima, A.; Tsukada, K.; Nagame, Y. *J. Radioanaly. Nucl. Chem.* **2019**, 320, 633.

Contents

- 1. Introduction**
- 2. Previous works to estimate the chemical character of Db**
- 3. Observing the chemical character of DbOCl_3 (2021)**

Experiment set-up

24 events ($\equiv 24$ Db atoms) were detected.

Counted **only** coupled two α -particles
detected within 3.5×5 seconds
(to exclude background noises)

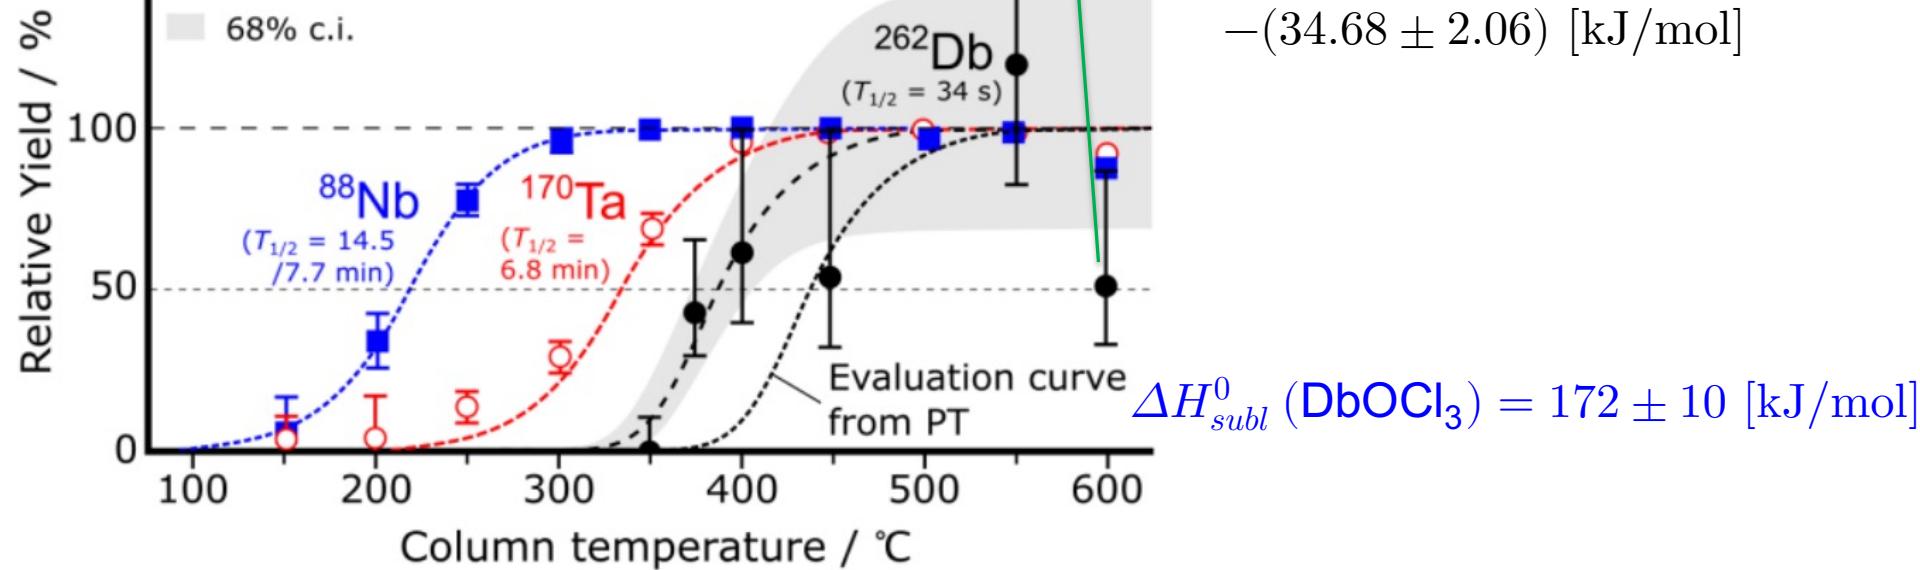

- 1) Chiera, N., M.; Sato, T., K.; Eichler, R.; Tomitsuka, T.; Asai, M.; Adachi, S.; Dressler, R.; Hirose, K.; Inoue, H.; Ito, Y.; Kashihara, A.; Makii, H.; Nishio, K.; Sakama, M.; Shirai, K.; Suzuki, H.; Tokoi, K.; Tsukada, K.; Watanabe, E.; Nagame, Y. *Angew. Chem. Int. Ed.* **2021**, 60, 17871.
- 2) Haba, H. *EPJ Web Conf.* **2016**, 131, 07006.

Volatility of DbOCl_3

Clustering (for detection) efficiency
may decrease when higher temp.

$$\begin{aligned}-\Delta H_{\text{ads}} (\text{NbOCl}_3) &= 102 \pm 4 \text{ kJ mol}^{-1} \\ -\Delta H_{\text{ads}} (\text{TaOCl}_3) &= 128 \pm 5 \text{ kJ mol}^{-1} \\ -\Delta H_{\text{ads}} (\text{DbOCl}_3) &= 130 \pm 6 \text{ kJ mol}^{-1}\end{aligned}$$

$$\begin{aligned}\Delta H_{\text{subl}}^0 &\approx \\ -(1.590 \pm 0.01)\Delta H_{\text{ads}} \\ -(34.68 \pm 2.06) \text{ [kJ/mol]}\end{aligned}$$

volatility: $\text{NbOCl}_3 > \text{TaOCl}_3 \geq \text{DbOCl}_3$

more volatile than expected

decreasing the ionic character

Appendix

Spin-Orbit splitting (classical model)

On the electron's side, the nucleus orbits.
→A magnetic field is generated.

$$H_{SO} = \frac{Ze^2}{m_e^2 c^2 r^2} sl$$

l: orbital angular momentum (s, p, d, f...)
s: spin angular momentum (\uparrow or \downarrow)
 $j \equiv l + s$

The energies depend on not only *l* but also *s*.

Pershina's calculation (1)

- introduction of relativistic effects -

Dirac equation

$$\widehat{\mathbf{H}}\psi = E\psi, \quad \widehat{\mathbf{H}} = c\boldsymbol{\alpha}\hat{\mathbf{p}} + \beta mc^2 + V(\mathbf{r})$$

$$\begin{cases} c\sigma\hat{\mathbf{p}}\varphi - (2mc^2 - V(r) + \epsilon)\bar{\varphi} = 0 \\ c\sigma\hat{\mathbf{p}}\bar{\varphi} - (\epsilon - V(r))\varphi = 0 \end{cases}$$

in a spherical potential

$$\psi_{nkm} = \begin{bmatrix} \varphi \\ \bar{\varphi} \end{bmatrix} = \begin{bmatrix} \frac{P_{n\kappa}(r)}{r} \mathcal{Y}_{\kappa m}(\theta, \phi, s) \\ -i \frac{Q_{n\kappa}(r)}{r} \mathcal{Y}_{-\kappa m}(\theta, \phi, s) \end{bmatrix}, \kappa = \begin{cases} -l-1 & (j = l + \frac{1}{2}) \\ l & (j = l - \frac{1}{2}) \end{cases}$$

$$\mathcal{Y}_{\kappa m}(\theta, \phi, s) = \sum_{\nu} \langle s\nu lm - \nu | jm \rangle Y_{lm-\nu}(\theta, \phi) \xi_{\nu}(s)$$

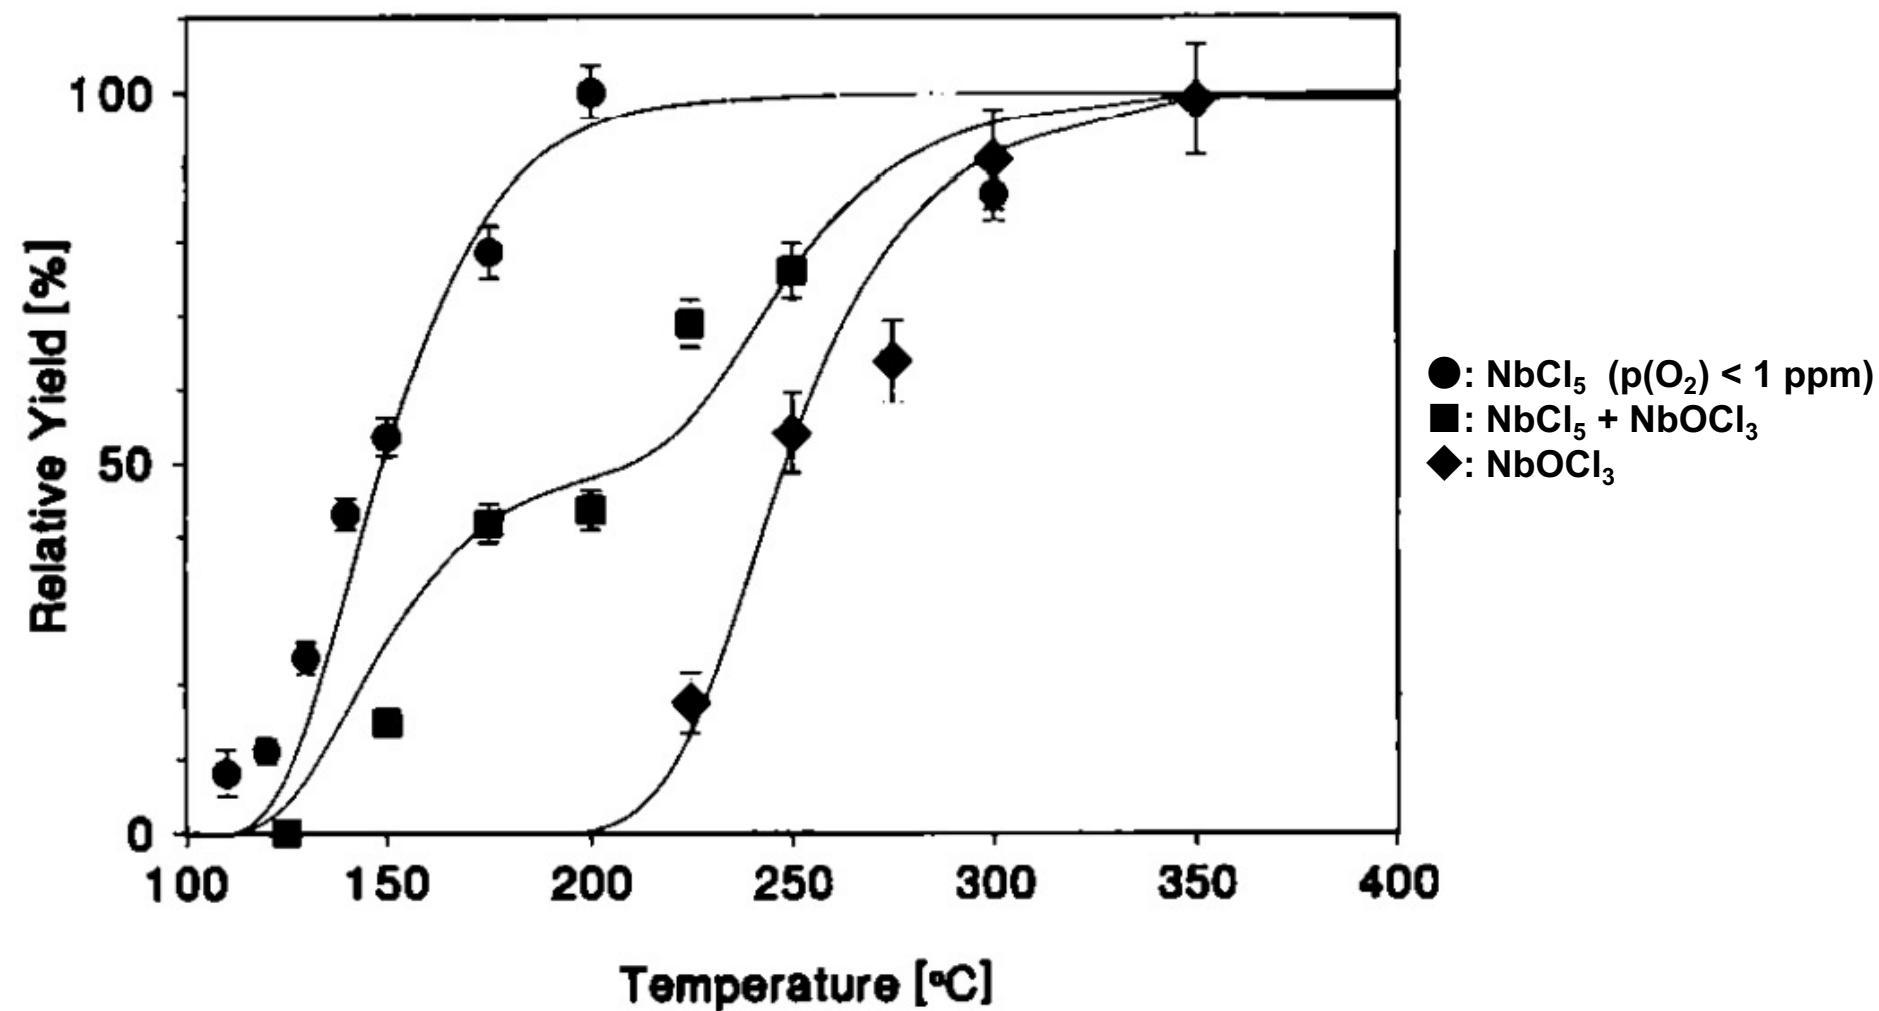

$Y_{lm-\nu}(\theta, \phi)$: spherical harmonic function

$$\begin{cases} c \left(\frac{d}{dr} - \frac{\kappa}{r} \right) Q_i(r) + V(r) P_i(r) = \epsilon_i P_i(r) \\ c \left(-\frac{d}{dr} - \frac{\kappa}{r} \right) P_i(r) - 2c^2 Q_i(r) + V(r) Q_i(r) = \epsilon_i Q_i(r) \end{cases}$$
